

Transportability analyses in Sweden

Anthony Matthews

Assistant Professor in Epidemiology and Causal Inference

Overview

- Registry based randomized trials
- Why do a transportability/generalizability analysis in Swedish data?

1

Registry based randomized trials (R-RCTs)

Sweden

- ✖ Sweden has a tax payer funded universal healthcare system
- ✖ Everyone that lives in Sweden has a personal number, which is used to capture data every time they use the healthcare system
- ✖ There are several mandatory national registers, such as population register, patient register, cause of death register, prescribed drug register etc.
- ✖ Also a selection (>100) healthcare quality registries that contain more detailed information on specific diseases. E.g., SWEDEHEART
- ✖ Can all be linked using the personal number

R-RCT

Pragmatic randomized trial that uses a clinical registry for one or several major functions for trial conduct and outcomes reporting

R-RCT

- ✖ When a clinician is collecting data for a healthcare quality registry, they are notified if the patient is eligible for an ongoing R-RCT
- ✖ If they consent, they are assigned to a treatment arm through a randomization module built into the registry

R-RCT

The registry helps to:

- ✍ Identify eligible patients
- ✍ Randomize
- ✍ Collect baseline and procedure characteristics
- ✍ Assist with collecting consent forms
- ✍ Identify clinical endpoints (there is no “active” follow up)

R-RCT

WHAT R-RCT'S CAN DO

Evaluate therapeutic options that are available in routine clinical care. We can find out what works best.

WHAT R-RCT'S CANNOT DO

Cannot design RCTs to experiment new pharmaceutical agents or medical devices.

Example

**Thrombus Aspiration in ST- Elevation
myocardial infarction
in Scandinavia (*TASTE* trial):**

A Cumulative Risk of Death**No. at Risk**

PCI+TA	3621	3500	3485	3470	3456	3440	3425
PCI only	3623	3503	3481	3466	3450	3435	3420

B Cumulative Risk of Rehospitalization for Infarction**No. at Risk**

PCI+TA	3621	3473	3441	3412	3384	3360	3336
PCI only	3623	3463	3424	3398	3374	3349	3327

**NO DIFFERENCE IN RISK OF DEATH OR
MOCARDIAL INFARCTION BY 1 YEAR BETWEEN
THOSE RANDOMIZED TO THROMBUS
ASPIRATION OR NO THROMBUS ASPIRATION**

TASTE used the SWEDHEART registry to:

- ✍ Identify eligible patients that had an MI and underwent PCI
- ✍ Randomize individuals to thrombus aspiration or no thrombus aspiration
- ✍ Collect baseline characteristics
- ✍ Assist with collecting consent forms
- ✍ Identify clinical endpoints of death and myocardial infarction

Embedding the trial within a registry meant TASTE was

CHEAP & QUICK

TASTE

Registry-based Follow-up

500,000 €

No. at Risk								
PCI+TA	3623	3404	3328	2821	2180	1505	864	184
PCI only	3621	3386	3315	2796	2200	1494	862	190

1st patient: June 2010
30 centers
33 months to full enrollment

Fröbert et al. N Engl J Med 2013 Oct 24;369(17):1587-97

Lagerqvist B et al. N Engl J Med 2014;371:1111-1120

Standard site-based Follow-up

15,000,000 €

No. at Risk								
Thrombectomy	5033	4734	4696	4678	4662	4647	4628	
PCI alone	5030	4727	4688	4666	4653	4642	4618	

1st patient: August 2010
87 centers
48 months to full enrollment

Why undertake a
generalizability/transportability
analysis in Sweden?

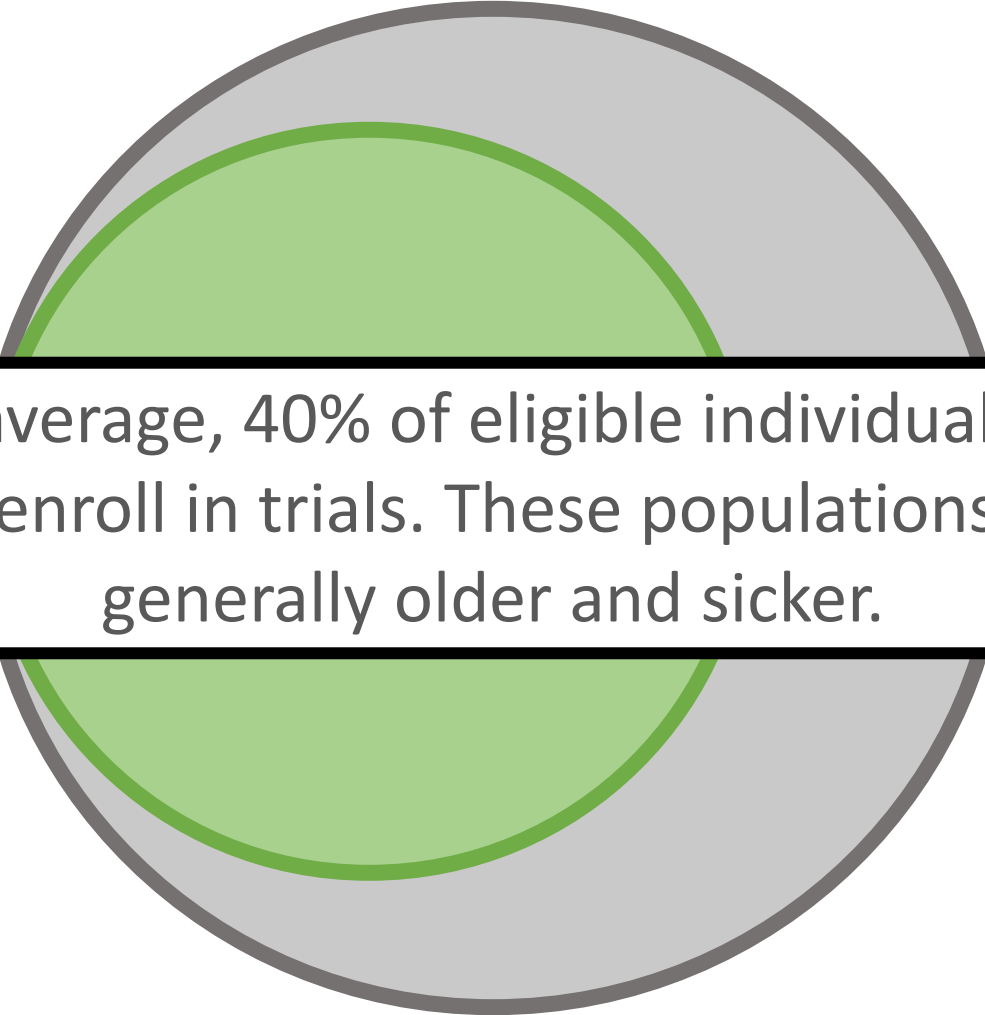

There remain questions around external validity
when we undertake R-RCTs

TARGET POPULATION

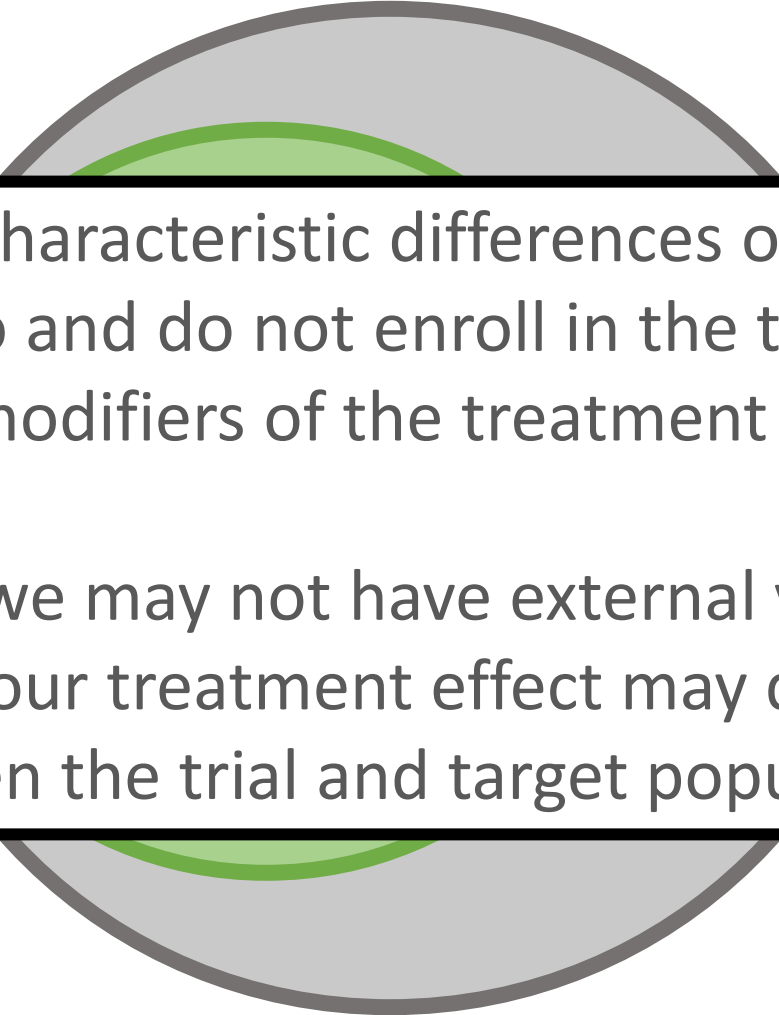

TARGET POPULATION

On average, 40% of eligible individuals do not enroll in trials. These populations are generally older and sicker.

TARGET POPULATION

If the characteristic differences of those that do and do not enroll in the trial are also modifiers of the treatment effect

Then, we may not have external validity and our treatment effect may differ between the trial and target populations

TARGET POPULATION

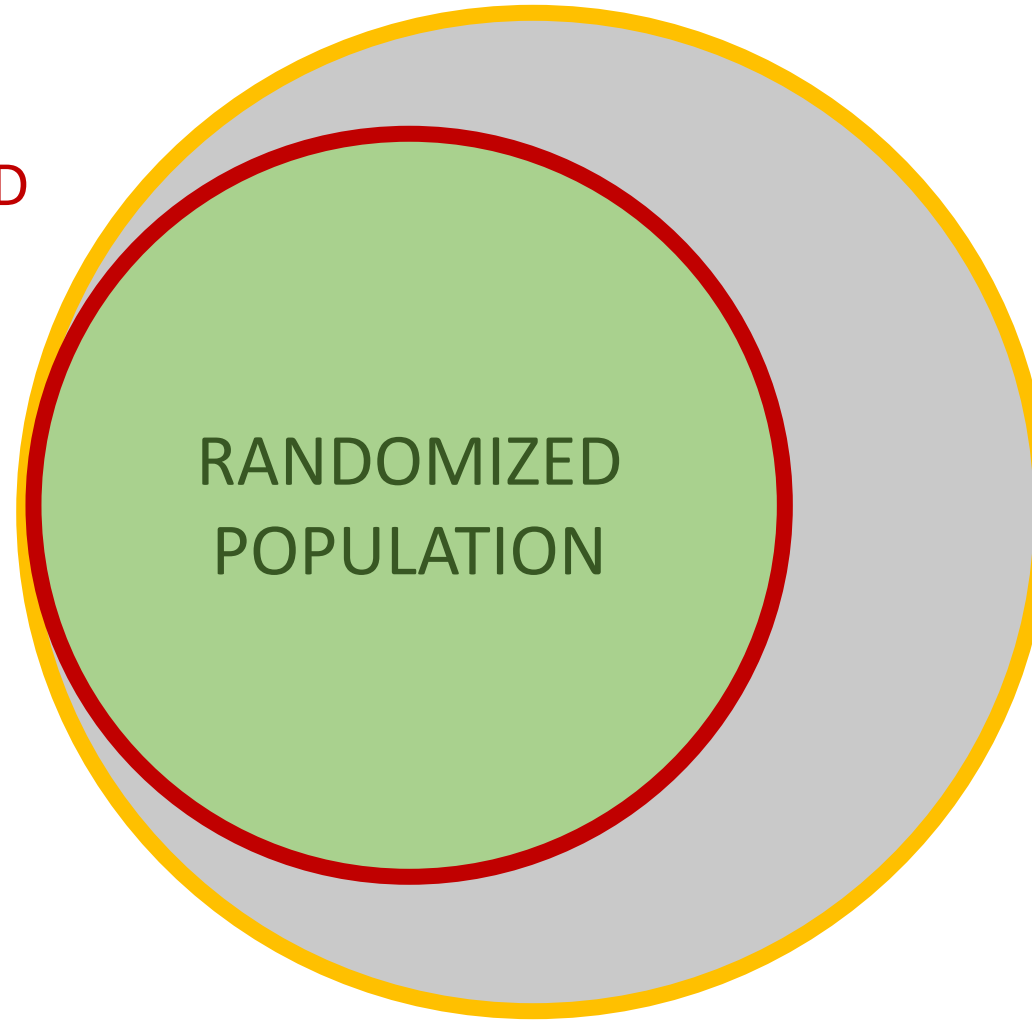

TRADITIONAL RCT
BASELINE DATA COLLECTED
IN RANDOMIZED
POPULATION

TARGET POPULATION

TRADITIONAL RCT

BASELINE DATA COLLECTED
IN RANDOMIZED
POPULATION

R-RCT

BASELINE DATA COLLECTED
IN TARGET POULATION

When a trial is embedded within a registry:

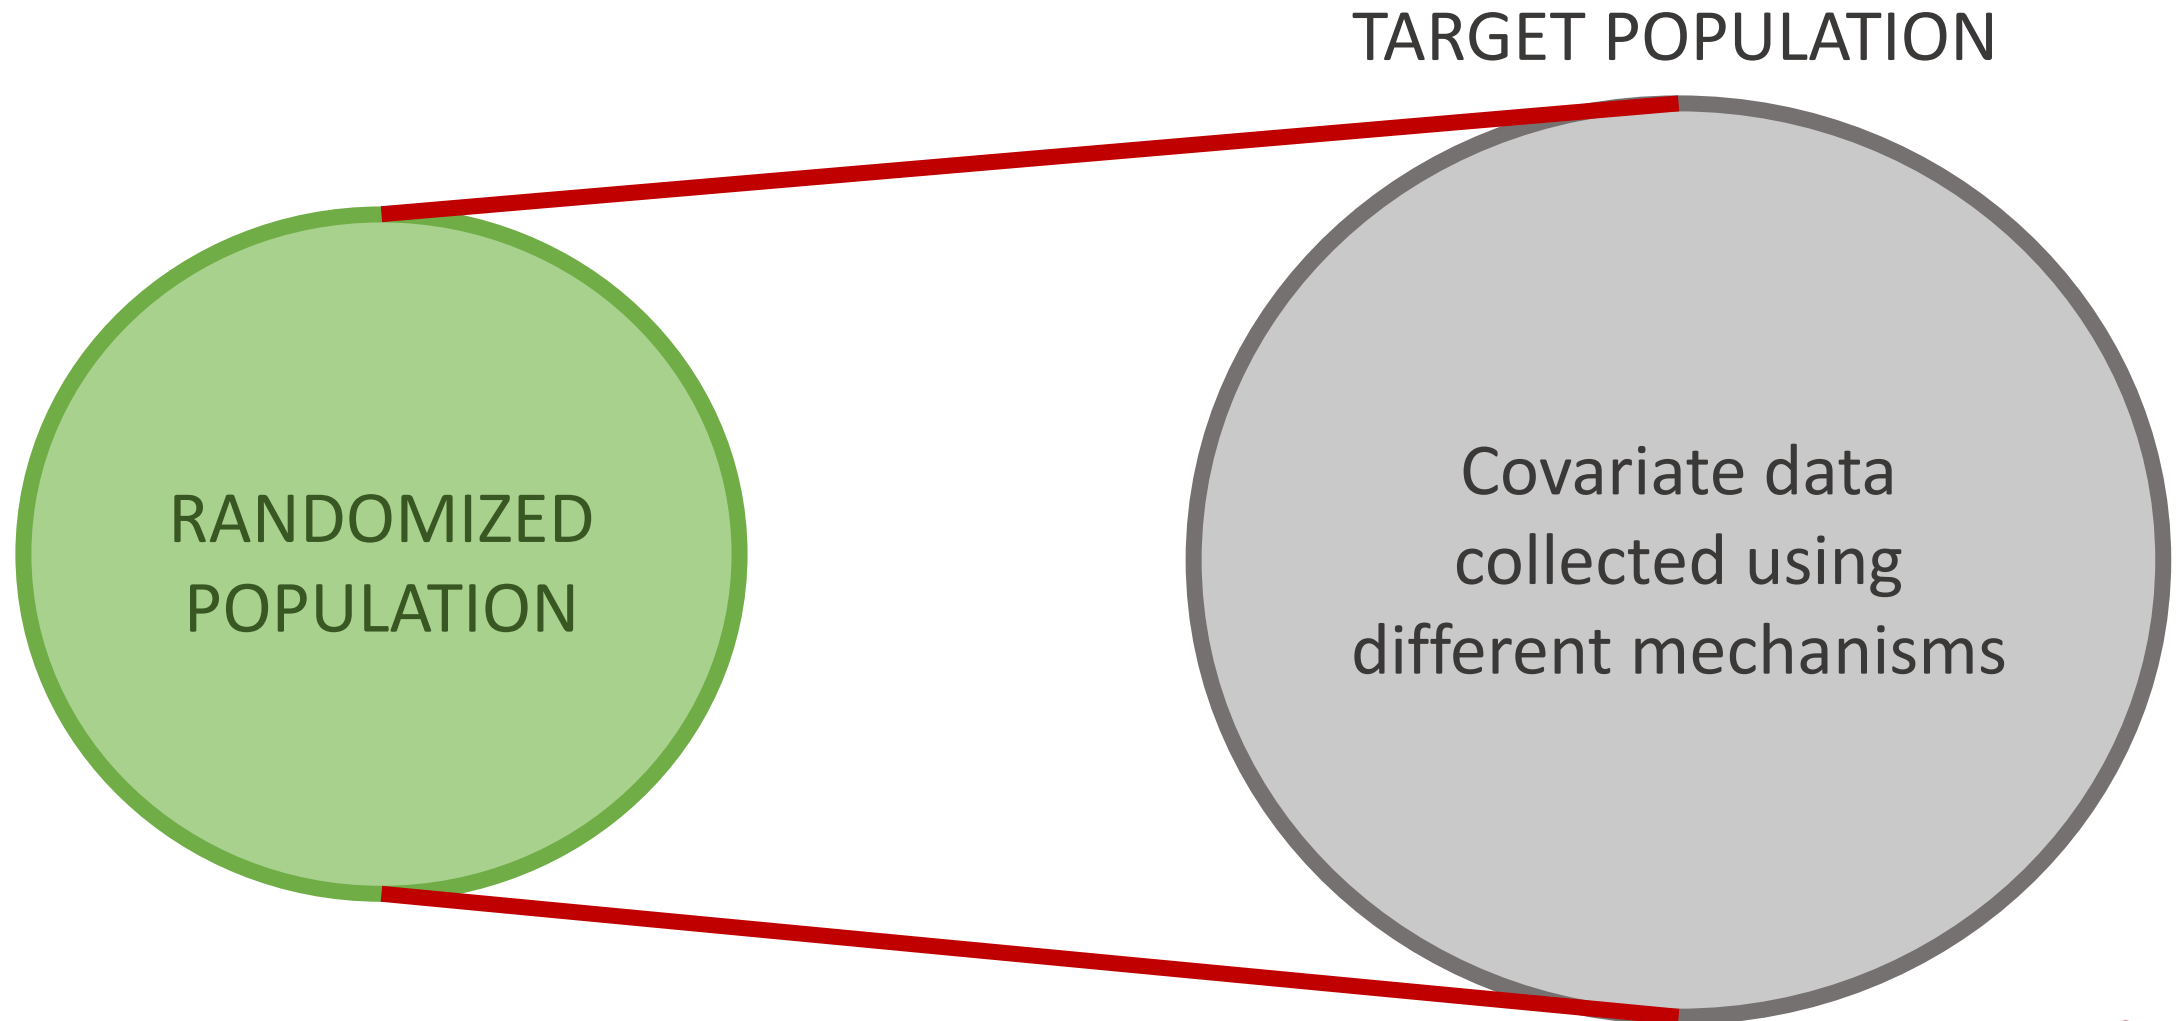

- ✖ Baseline characteristics are collected in whole target population as part of the standard data collection for the registry
- ✖ The data generating mechanism is the same for everyone, regardless of if they take part in the trial
- ✖ We can get **the same** baseline data for individuals that were and were not randomized

TRANSPORTABILITY ANALYSIS - TRADITIONAL RCT

TRANSPORTABILITY ANALYSIS - TRADITIONAL RCT

TRANSPORTABILITY ANALYSIS - TRADITIONAL RCT

TARGET POPULATION

We make an assumption that the covariates from the trial and the target population are measuring the same thing.

But, if you are using data from different countries/healthcare systems they may not be

e.g., there may be different diagnosis or prescribing thresholds

TRANSPORTABILITY ANALYSIS - R-RCT

As always, we use baseline covariate data on the potential effect modifiers to transport effect estimates from the randomized to the target population

TRANSPORTABILITY ANALYSIS - R-RCT

As always, we use baseline covariate data on the potential effect modifiers to transport effect estimates from the randomized to the target population

As data from both the trial and target population are collected from the underlying healthcare registry, data are collected in the same way.

We don't have to make assumptions that the trial data and observational data are collecting the same info, because THEY ARE

Why undertake a transportability/generalizability analysis in Sweden?

- ✖ There are currently a lot of R-RCTs being undertaken in Sweden (cardiology, cancer, respiratory diseases etc.)
- ✖ But these trials still cannot experiment on everyone eligible for the treatments under study – our target population
- ✖ We can use data from the SAME registries and perform transportability analyses to estimate the effects in those not included in the R-RCTs
- ✖ Because the data are collected from the same registry, we do not have to make assumptions about the data generating mechanisms

Thank you
